Can I use the JSpell SDK with my own custom components?

Support Team - 2019-11-19 - in Pre-Sales Technical

It is very easy to JSpell enable your Java custom components. You simply need to implement the methods of our interface JSpellTextComponent. This interface has methods to set and get text, highlight text and get the base parent Frame. By implementing these methods, you can pass an instance of your custom component to the built in JSpellErrorHandler and your component will work seamlessly with JSpell.
